Part B — Comparison of VS Code Extensions

Among the extensions, Prettier changed my day-to-day typing and editing experience the most because it automatically formats the code and makes it easier to read. Prettier is mainly related to code formatting, while Python and Java extensions support language-specific coding, and GitLens and Live Share focus more on collaboration and code history. I would keep Prettier and GitLens enabled for most projects, while Python and Java extensions would be useful when working with those specific languages. Live Share makes pair programming more interactive than screen sharing because both students can work on the same file in real time, see each other's cursor and edits, and collaborate directly instead of only watching another person's screen.
